Para este caso se consideró solo direcciones absolutas, para las relativas existe un fuerte problema con las barras (/), pues estas son usadas como parte de la sintaxis elemental de HTML, para lograr discernir entre una etiqueta y una ruta relativa se requiere de más contexto, que el autómata por si solo no puede considerar.

$$a+://(c|-|_)+(.(c|-|_)+)+((:b+)|\epsilon)(/c^*)^*$$

Siendo a cualquier letra

b es cualquier numero

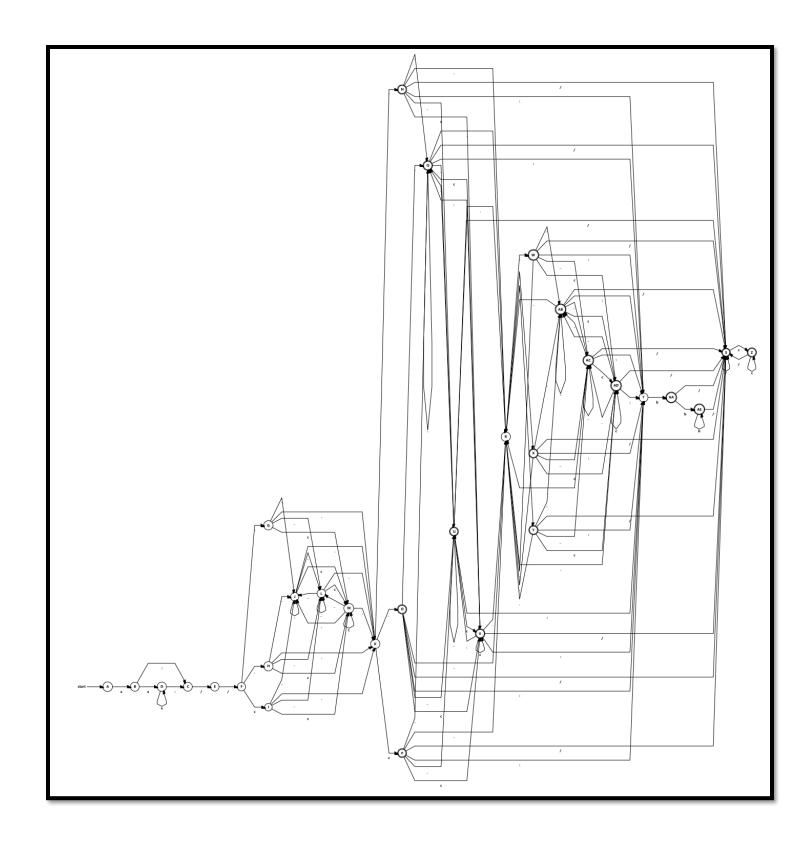

c es a con b
